Prediction Summary

Context Assignment	Prediction Human	AI Probability 0.5%	Human Probability 99.5%
------------------------------	----------------------------	-------------------------------	-----------------------------------

Decision reason: The code is classified as Human-written because the Human probability is above 70%.

Caution: This result alone is not enough. Please also review the explanation and reasons before making a final decision.

How to Read the Explainability Values

Explanation: Positive SHAP values support the AI-generated class. Negative SHAP values support the Human class. A larger absolute SHAP value means the feature had a stronger influence on the prediction.

Group Influence Percentages

Group	Influence	Features	Meaning
SYNTACTIC	80.6%	3	Syntactic features look at the code structure, such as loops, conditions, nesting, and AST patterns.
LEXICAL	19.4%	1	Lexical features look at the surface style of the code, like naming, line length, keywords, and literals.

Top Features Explaining the Decision

These are the most influential features behind the prediction, ranked by SHAP magnitude.

#	Feature	Group	SHAP	Direction	Explanation
1	nttf_While	SYNTACTIC	-0.2660	supports_huma n	This feature shows how often while loops appear in the code.
2	ntad_While	SYNTACTIC	-0.2259	supports_huma n	This feature shows how deeply while loops appear in the code.
3	emb_269	SYNTACTIC	-0.2222	supports_huma n	This is a learned embedding feature. It captures hidden code patterns and is linked to readable feature groups using SHAP-based correlation.

KASIF Report

AI Code Detection Summary

#	Feature	Group	SHAP	Direction	Explanation
4	emptyLinesDensity	LEXICAL	-0.1716	supports_human	How often empty lines appear in the code.
